The Access™ Demonstration Network is protected by U.S. Patent numbers 5,422,631 and 5,646,602 with other patents pending.

Access, Audio Authority, the double-A symbol, SilenTouch, AutoLimiting and TheftAlert are trademarks of Audio Authority Corporation. The software imbedded within the Access™ System is not sold, but rather licensed for this product specific use. The original purchaser is licensed to use this software in this product and this application only. Under this license, the software may not be reproduced, copied, disassembled, distributed by any means, licensed, rented, sold, or in any way revealed to or used by a third party.

ProLogic™, Dolby Digital™, and AC-3™, are Trademarks of Dolby Laboratories.

Introduction

The Model 902 and 903 Control Panels connect to the Access™ Demonstration Network switching system to show the products currently selected to play and to provide an easy method of controlling the display to select products, store and recall systems, and activate special features. The panel controls are divided into three functional sections - a selection keypad, a Product Group selection area and (902 only) an Equal Volume Comparison (EVC) section. See the illustration below.

The Selection Keypad includes:

- 0 – 9 numeric keypad
- UP and DOWN arrow keys for scrolling through selections
- A/B/C comparison keys for easy system comparison
- SECURE key for accessing various secure modes and system features
- SilenTouch™ circuit indicator
- Theft Alert™ indicator
- infrared remote receiver window

The Product Group Section includes the following for each of the 8 Product Groups:

- a Select key for activating each Product Group
- an LED indicator that illuminates when each Product Group is Selected
- a 2-digit display that shows the number of the ACTIVE component
- an ID window for slide-in Product Group labels

The Equal Volume Comparison (EVC) section includes:

- 902 and 903: 3-character display window for displaying command prompts, diagnostic information and software version number

For 902 only:

- 3-character window also displays volume, attenuation, and muting levels
- keys to activate, adjust, calibrate and store EVC settings
- keys to activate and adjust two levels of audio muting
- a key to change the window's display function from EVC/Mute Level to a real time Sound Pressure Level (SPL) display

In addition to the 902 or 903 Control Panel, the Access™ System can also be operated by:

- Product Select Buttons - push-button located next to each product
- Model 905 Remote Control - a small, inexpensive, full-function remote (included with the 902 and optional for the 903)
- Compatible PC/Modem - system input/output via the control panel's RS-232 serial port.

One unique characteristic of the Access System is that all of these different modes of product selection may be used in the same system. This means that your system could contain a Control Panel, an IR Remote, and Product Select Buttons, as well as an external computer or modem hooked to the Control Panel's RS-232 port. So, it is important for you to be familiar with your system and know the different modes of access (input) to your system.

Model 902/903 Control Panel - Rear View

(for simplicity, only larger component parts are depicted)

Configuring the Control Panel

On the back of the Control Panel is a bank of Configuration DIP Switches that enable or disable certain functions. These switch settings should have been adjusted to match your merchandising requirements during the installation, however, they may be changed at any time. The following chart details the function of each switch.

<i>Switch</i>	<i>Function</i>	<i>Factory Setting</i>	<i>Comment</i>
A	Key Click	OFF	Provides audible feedback of key presses (beep)
B	Demo Mode	OFF	Turn ON only when control panel is not connected to a system as a "Training Mode"
C	Systems Product Group	ON	ON makes the last unused Product Group capable of storing and recalling 99 system configurations
D	Not Currently Used	OFF	
E	Previous Selection Key	OFF	OFF = "C" key is the third "flash memory" key ON = "C" key is toggle between current selection and previous selection
F	903 Mode	ON	This switch must be OFF for the Model 902 and ON for the 903
G	Internal IR Receiver	ON	Turn ON if using Model 905 remote control
H	Auxiliary IR Port	OFF	Turn ON if using 990 auxiliary infrared remote receiver.

Switch-C is of particular interest for most retailers. Turning Switch-C to ON allows the last Product Group position on the Control Panel to be used for storing and recalling up to 99 different component systems. If the system includes 904 Product Group Expanders, the Systems Product Group will be the last position, on the last 904. When this feature is enabled, the Systems Product Group will display dashes (--) or a System number in its window.

For those whose merchandising emphasizes direct A/B type product comparisons, Switch-E offers an interesting option. Turning Switch-E to ON will change the function of the C-Key from a temporary system storage key, to an A/B key that reverts to the previous selection whenever it is pressed. This allows for a simple, one-button A/B capability without having to "store" anything. This feature is especially useful when your demo includes putting the remote control in the customer's hand and letting him/her switch at will, using just one button.

If your installation includes the Model 990 Ceiling-Mounted Infrared Receiver, then Switch-H must be enabled for that device to operate. If there is no remote control in your system, you should turn Switch-G OFF, to eliminate any possibility of stray infrared signals or other "noise" from affecting the display.

The configuration DIP switches are read by the Control Panel each time it is reset or powered up. Therefore, for any changes to the configuration DIP switches to become effective, the Control Panel must be reset (see Secure Features section, Secure 88) or powered down and restarted for the changes to be recognized.

Connecting the 902 or 903 to the Access™ System

Control panels connect to the Access System via the Model 980 System Module (See Hookup Diagram below). They also have terminals for the connection of an auxiliary ceiling-mounted Omnidirectional Infrared Receiver, which extends the range of the remote control's operation.

Model 902 Hookup Diagram

Definitions of Special Terms

To best understand and use this powerful merchandising tool, it will be helpful to clarify a few terms used throughout this manual.

COMPONENT	The merchandise or products connected to the switching system.
SWITCH MODULE	Small, intelligent, circuit board assembly that provides the actual switching for 4 to 8 components in the system. All components are connected to switch modules, which in turn selectively interconnect products for demonstration. Your system may contain several types of switch modules – Low-Level modules for sources or amplifier inputs, High-Level modules for amplifier outputs, Speaker modules, Video modules, and so forth. The quantities and types of modules contained in your system depend on the number and types of components in your display.
SYSTEM BUS	A set of wires which interconnect all switch modules allowing control signals (instructions) to flow between them. The system bus is color-coded, using red/yellow/black/blue wires and operates as an RS-485 serial interface.
ADDRESS	Like your street address, a unique logical numeric code assigned to each module to differentiate it from all others and enable reliable delivery of instructions via the System Bus. Each module in the display can “talk” to and receive instructions from the Control Panel, Product Select Buttons, the 905 IR Remote, a local PC, or a PC via modem.
Product Group or GROUP	A group of functionally similar components within the display, such as CD players, amplifiers, front speakers, subwoofers, VCRs, etc. The 902 Control Panel has provisions for 8 Product Groups and has capacity for 99 components in each Product Group. The number of Product Groups can be expanded by adding a 904 Product Group Expander. Each 904 Expander adds 8 more Product Groups to the system, each capable of 99 components. You can add three 904s making the Access System’s total capacity 16 electronic Product Groups and 16 speaker Product Groups, each capable of handling 99 products, for a total of 3,168 products in a system.

SELECTED PRODUCT GROUP	The Product Group currently selected to be the object of keypad input. A Product Group is selected by pressing its Select Key and confirmed by the illumination of its red LED Indicator. When "selected," input from the numeric keypad will be displayed in the selected Product Group's 2-digit window and directed to its switch modules.
ACTIVE	Any Component or Product Group that is currently selected to play, i.e. part of the signal path. The 2-digit number for all active components is shown in its respective Product Group window.
PRESS	A momentary press and release of a key . The PRESS is used for primary key functions like entering numbers or selecting a Product Group.
DOUBLE-CLICK	To press and release a key twice in rapid succession. Used for alternate key functions, such as turning off an active Product Group.
LPRESS	To press and hold a key until the Control Panel beeps (about 1/2 second) then release. LPRESS is generally used to store values. Examples are defining systems and storing current selections using A/B/C keys, etc.
HOLD	To HOLD a key down while PRESSing other keys, like the "Shift" key on a computer keyboard.
TIMEOUT	The automatic termination of an incomplete keypad or remote control command after a set amount of time; the control panel is restored to its previous state.

Starting the System the First Time

Once installed, the Access™ System should be tested prior to connecting components to the switching modules. A self-test routine is automatically initiated when you first power-up the system. When the system is powered up, you should observe the following sequence of events in the system.

- A. 902/903 Test Sequence. If you encounter any problems, keep a note pad handy to record results as they are reported in the Control Panel windows.
1. All display segments and indicators on the control panel are lit briefly (lamp test).
 2. The EVC window at the left of the panel displays software version (e.g., 3.4).
 3. A System Bus Test is performed. If the word "bUS" flashes in the EVC window, it indicates a problem with a system bus cable or switching module. To find the faulty cable or module, use this process of elimination:
 - Carefully unplug the yellow-red-blue-black system bus cable from a switch module to isolate it from the 980 module, then press any key on the control panel.
 - If "bUS" still appears on the EVC window, plug the cable back in and try a different module.
 - If "bUS" disappears from the EVC window, you have isolated the module or section of bus cable that is faulty. Call Audio Authority® Technical Service at 800-322-8346 for assistance with parts replacement.
 4. After the bus test, the diagnostic program scans the active range of module addresses in every Product Group. You will observe these module addresses counting up in the EVC window as the product group number is displayed in each group's Product Group window.
 - If the numeric displays begin flashing at any time during the module scan, two or more modules have the same address. Duplicate addresses are disallowed because the control panel is unable to tell two identically addressed modules apart. Note the last group

number displayed in the Product Group windows and the module number displayed in the EVC window and try to find two modules that both have this address. For example, if the control panel is flashing, the EVC window displays 002, and the third Product Group window shows S4, you would look for two speaker modules (932) with the same address of "Group 4, Module 02, Right." Remember that pairs of speaker modules must have the same Group and Module ID address, but must be identified LEFT and RIGHT to avoid a duplication.

Note: In Control Panels, "E" refers to Electronics switching modules and "S" refers to Speaker switching modules.

- As each new group number appears in a Product Group window, the EVC window counts up the number of modules in that group that can be recognized. Write down the highest number reported in the EVC window and the Group number with it. For each group, compare the reported module tally with a physical count of the modules. For example, your system has four "E Group 0" modules, six "E Group 4" modules, and three pairs of "S Group 4" modules. The top PG window displays "E0" as EVC scans up to 4 (good). The second PG window displays "E4" as EVC scans up to 5 (bad). The third PG window displays "S4" as EVC scans up to 3 (good). In this case you would look for a mis-addressed, unplugged, or faulty E4 module (Electronics Group 4).
- If the module count in a group does not match the number of modules you actually have, look for disconnected or mis-addressed modules.

B) After the diagnostic routine, the Control Panel software version number will be displayed, and the Control Panel will BEEP to indicate that it is ready for use.

At this point the Control Panel should display "--" or numbers in the window of each valid Product Group. If this exact sequence of events does not occur, there is a problem with the installation. Do not proceed with connecting product to the system until the all installation problems have been resolved. If you need assistance, call our Technical Service Department toll-free at 800/322-8346.

When the system is turned on each time hereafter, the selection last made, or a default system that has been programmed will appear in the Product Group windows.

How Product Groups Appear on the Control Panel

Module addresses set during installation determine the order in which Product Groups appear on the Control Panel. If the rules for addressing described in the Installation Manual are followed, the first (top) Product Group should be Sources, with the next logical component Product Group in the signal path being the second Product Group (e.g. amplifiers, or maybe preamp EQs or processors). Here are two examples of how Product Groups might be configured on your Control Panel:

<i>Product Group Window</i>	<i>Home Audio Display</i>	<i>Car Audio Display</i>
1	A/V Sources	Head Units
2	Surround Receivers	Preamp EQs
3	Front Speakers	Front Amps
4	Center Channel Speakers	Rear Amps
5	Rear Speakers	Front Speakers
6	Subwoofers	Rear Speakers
7	--	Sub Amps
8	Systems (up to 99)	Subwoofers

Notice that the Product Groups are in a logical order that represents the normal signal flow of the components if they were "hard-wired." Notice also that speaker Product Groups follow their related amplifier's Product Group. Your particular demonstration needs may not require that all Product Groups be used,

leaving some vacant (i.e. no attached switching modules). If this is the case, then your 902/903 Control Panel can be used very creatively by programming a single promotional system into each unused Product Group, for instant one-button activation. Such a configuration might use Product Groups 4 - 7 like this:

<i>Product Group Window</i>	<i>Audio Video System</i>
1	Sources
2	Receivers
3	Speakers
4	Manager's Special
5	\$649 Installed!
6	The Latest Technology
7	Advertised Special \$499
8	Systems

The last Product Group can store up to 99 preprogrammed systems of your choice if there are no components assigned to that Product Group. To enable this feature, DIP Switch "C" on the Control Panel's Configuration DIP Switch array must be ON. See the diagram on page 3.

Blank and printed labels for all types of component Product Groups are included with your 902 or 903 Control Panel. However, you may wish to make your own labels using different words, symbols or languages, maybe even on different colored paper. If so, custom label inserts can be printed on 20 - 24# paper using the following specifications:

Label size: .45" H x 2" W

Text Center: 11/16" from left edge

Max. Text Width: 1-3/8"

Max. Text Height: 3/8"

Selecting Products

To select a product from the Control Panel by the product number:

1. PRESS the desired Product Group Select Key if that group is not already Selected.
2. Enter a 1 or 2 digit product number using the numeric keypad (the Product Group display clears and then flashes the new entry).
3. PRESS the Product Group Select Key to enter your new selection.

You may also simply wait 2 seconds and the new selection will be entered automatically without PRESSing the SELECTED Product Group key. Any component in any Product Group can be SELECTED in this manner (Auto-Enter).

To play multiple pairs of speakers in the same Product Group:

1. Make sure the desired speaker Product Group is SELECTED (LED ON).
2. Enter 1 or 2 digit number of speaker pair you wish to add and LPRESS Product Group key.

The SELECTED speaker's Product Group window will alternately display the two speaker pair numbers. You may add more speaker pairs in the same manner (depending on system limitations set during installation), but remember that you could be presenting a severe load (low impedance) to the amp's output, so be careful. Check the receiver or amplifier manufacturer's recommendations for maximum number of speakers.

To deselect one of the speaker pairs playing in the same Product Group:

1. Enter the 1 or 2 digit number of the pair you wish to deselect, and
2. PRESS the corresponding Product Group key or simply wait for Auto-Enter.

Note: The maximum number of speakers that can play at the same time is determined by DIP Switch settings on the 980 System Module Board. If you cannot select multiple speakers to play simultaneously, please refer to the Installation Manual's instructions on setting the 980 System Module or call the factory at 800-322-8346.

To select a product from the Control Panel using the UP/DOWN arrow keys:

1. PRESS the desired Product Group button if not already SELECTED.
2. Use the UP key (▲) to select next higher numbered product in Product Group and press repeatedly to continue advancing.
3. Use the DOWN key (▼) to select next lower number product in currently SELECTED Product Group.

DOUBLE-CLICK of the UP/DOWN keys will increment/decrement product selection by a factor of 10. If UP/DOWN arrow keys are used to scroll through a speaker Product Group where multiple pairs of speakers are ACTIVE, then the most recent speaker selection is incremented or decremented. The other ACTIVE speakers in the Product Group are not affected.

To turn off all products in a Product Group:

This may be done by either of two ways:

- 1) Deselect the Product Group by DOUBLE-CLICKing its Select Key, or
- 2) Deselect the ACTIVE product within that GROUP by entering its number again.

In both cases the result is the same. The Product Group window will display dashes (–), indicating that the Group is available, but not ACTIVE.

Storing and Demonstrating Component Systems

There are three different ways to store complete systems with 902 or 903 Control Panels. During product demonstrations, it is normal to “build” a system for your customer as you qualify his/her needs during the selling process. Once the components of the desired system are active, the system may be stored in one of the following ways:

- 1) LPRESS the A, B, or C keys. These keys are essentially used like scratchpad or “flash” memory. Once a system has been stored in this way, PRESS A, B, or C to instantly compare the stored systems. Future systems can be stored in A, B, or C by repeating the same process thereby overwriting the previously stored systems.
- 2) LPRESS any unused Product Group Select Key to store the system that is currently playing. Once stored, the system can be SELECTED by simply PRESSing the Product Group key. When selected, “SY” will be displayed in the system’s Product Group window and all the components comprising the system will have their numbers displayed in their respective Product Group windows. Future systems can be stored in the same manner by simply overwriting with a newly selected system.
- 3) Store as 1 of up to 99 systems in the Systems Product Group. To do this:
 - Select the Systems Product Group by PRESSing its Select Key. (DIP Switch-C must be ON).
 - Enter a 1 or 2 digit number (e.g. #22) for the system.
 - LPRESS the Systems Product Group’s Select Key to store.

Continue this procedure to store up to 99 systems. Systems that have been temporarily stored using the A, B, or C keys may be copied to the System Product Group to prevent being erased.

To select a system previously stored in the System Product Group:

- 1) SELECT the Systems Product Group,
- 2) Enter the 1 or 2 digit system number you wish to play, and
- 3) PRESS the Systems Product Group key or wait 2 seconds for auto-enter.

You may also use the UP/DOWN arrow keys to scroll through systems.

Equal Volume Comparisons (902 Only)

The Equal Volume Comparison, or EVC Section of the Control Panel, provides a variety of advanced features to enhance your demonstration capabilities. Generally, these features are:

- 1) Automatically adjusting for equal volume levels among speakers when performing A/B-type comparisons.
- 2) 2 levels of audio Muting to instantly lower the demo volume by a preset amount when you need to talk over the music.
- 3) Digitally display in decibels the current Sound Pressure Level (SPL) in the demo area.

The concept and need for equal volume product comparisons is based on two facts. First, a limitation of human hearing is that our sensitivity to low, middle, and high frequency sounds varies with the volume level. As the volume level decreases, our sensitivity to low and high pitched sound becomes progressively worse. Conversely, as the volume, or SPL, increases our hearing steadily improves to provide a more even response across the full audio spectrum. For this reason, in any A/B-type product comparison, the products being auditioned must be played at exactly the same loudness to negate this deficiency in our hearing.

The second factor is that audio components vary randomly in their electrical sensitivity, or efficiency – that is, with the exact same input signal, two different components will likely produce differing amounts of output. This characteristic is most pronounced in loudspeakers, but is also found in amplifiers. However, a product's efficiency is not necessarily a measure of quality or accuracy.

These two factors combined mean that in any A/B-type product comparison it is imperative that the demonstration system provide a convenient and accurate method to eliminate any volume differences between the products being auditioned. Otherwise, the listener will almost always hear the louder product as sounding better, even when its reproduction quality may actually be inferior. For valid product comparisons, all products must be playing at exactly the same sound pressure level. That is what EVC is all about.

Despite its importance and benefits, providing equal volume demonstrations in a showroom setting usually requires additional education, training, time and effort for salespersons. However, with the Model 902, this critically important aspect of your product presentation can happen automatically! The 902's EVC Section is able to sample the relative efficiency of each component within a Product Group and store its relative efficiency. When EVC is ON, selecting a product automatically recalls its relative efficiency, adjusts its loudness, and allows the 902 to play each product at exactly the same volume level.

Equal volume adjustments are performed by the Model 987 Audio Level Module, which is included with the 902 Control Panel. This 987 Module is inserted in the system's signal path just prior to the input bus of each amplifier group (see diagram). Each 987 has 4 channels (two stereo pairs) available. Additional 987 Modules can be used to adjust more than 4 channels. The 902 also includes a precision calibration microphone (typically hung from the ceiling) which allows the 902 to measure the SPL in the demo area, and in turn control the 987 Audio Level Module.

EVC can only be applied to corresponding speaker and amplifier Product Groups, that is, electronics and speaker Product Groups with matching Group numbers. When a valid Product Group is selected, the EVC window will display two dashes (--) if EVC is OFF, or the selected product's relative efficiency (an attenuation value between 0.0 and 30.0 dB) if EVC is ON.

The EVC section's control keys and multipurpose display window are associated only with the currently SELECTED product in the ACTIVE Product Group (the one with its red LED ON). When EVC is ON, that product's relative efficiency in decibels is shown in the display. The least efficient product in the Group will display a value of 0.0 dB, or no attenuation. More efficient products will display the number of decibels of attenuation necessary to achieve equal volume.

To turn the EVC Feature ON or OFF:

- 1) SELECT a valid Product Group for EVC by PRESSing its Select Key.
Valid Product Groups are typically speakers and amplifiers. EVC cannot be applied to source Product Groups.
- 2) PRESS the ON/SPL key in the EVC section of the panel to toggle between ON and OFF.

To automatically calibrate products for equal volume:

- 1) Verify that EVC is ON.
- 2) SELECT a valid Product Group to calibrate.
- 3) Adjust volume to moderately loud listening level.
- 4) LPRESS the AUTO-CAL key.

This will activate the 902's pink noise generator and initiate the automatic calibration sequence. Each product in the group will be selected in turn and its relative SPL measured by the 902's microphone. The 902 will calculate each product's relative efficiency and automatically store that value in memory (overwriting any previously stored value) as a default for whenever that product is selected.

To manually adjust attenuation values:

- 1) Verify that EVC is ON.
- 2) SELECT a valid Product Group to manually adjust.
- 3) Adjust volume to moderately loud listening level.
- 4) PRESS the P-NOISE key to activate the pink noise source, or use music.
- 5) Use the ATTEN. LEVEL UP (▲) or DOWN (▼) arrow keys to increase or decrease the attenuation value.
PRESS arrow keys to increment 0.2 dB.
DOUBLE-CLICK arrow keys to increment 10dB.
HOLD arrow keys to increment at a steadily increasing rate.
- 6) To store a new attenuation value for the currently SELECTED product in the ACTIVE Group, LPRESS the ON/SPL (STORE) key until it beeps.

NOTE: Manual adjustments which are not saved (Step 6) as the new default, will not be retained for later use.

- 7) Repeat Step 5/6 for each product you want to adjust.
- 8) Turn off Pink Noise Source by PRESSing the P-NOISE key, or PRESS the ON/SPL key to turn EVC feature OFF.

Audio Muting (902 Only)

The 902's EVC section also provides two programmable levels of audio Muting. Muting enables the operator to immediately lower the audio level by a predetermined amount during demonstrations to allow conversation with the customer without having to yell over the music. It is also convenient for situations like answering the phone in the demo area, or regaining control when self-serve customers get too loud. Muting can also be used as a "safety" feature to protect from unexpected volume blasts when selecting high powered amplifiers.

Whenever audio Muting is engaged, the amount of muting attenuation will flash in the EVC display window. The factory default settings are:

- 20dB of attenuation for Muting Level 1, and
- 30dB of attenuation for Muting Level 2.

To activate Muting Level 1:

- PRESS the MUTE Key.

To activate Muting Level 2:
DOUBLE-CLICK the MUTE Key.

To change the amount of Muting attenuation:

- 1) HOLD the MUTE Key while using the ATTEN. LEVEL up (▲) or down (▼) arrow keys to adjust.
- 2) RELEASE the MUTE Key when the desired muting level is displayed.

The displayed value will become the new default attenuation for the currently engaged Muting Level. Level 1 and Level 2 attenuation are independently adjustable.

To turn off Muting (or revert Muting Level 2 back to Muting Level 1)
PRESS the MUTE Key.

SPL Meter Display (902 Only)

Using its EVC microphone, the 902 Control Panel can digitally display in decibels the Sound Pressure Level (SPL) in the demonstration area, up to 100 decibels. SPL values being displayed can be distinguished from EVC or Muting attenuation levels because they contain no decimal point.

The 902 can also monitor the demo area and automatically engage Muting Level 2 whenever the SPL exceeds a predetermined level (See Secure Feature 93 for more information).

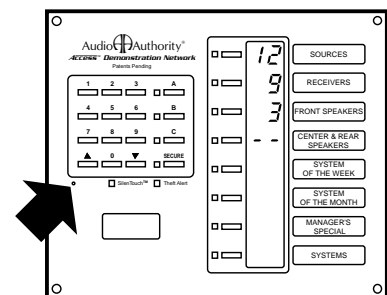

To toggle the Sound Pressure Level display ON/OFF
DOUBLE-CLICK the ON/SPL Key.

About Secure Features

Beyond the basic operational features are many special features and functions that can dramatically enhance the switching system's convenience and utility. Secure Features allow you to control and restrict access to the display, put the switching system into the SLEEP mode, protect stored systems from accidental erasure, etc. These special features are initiated with the SECURE Key. Properly used, Secure Features will eliminate most of the risks associated with giving customers access to the switching system, making offensive "Please Don't Touch" signs unnecessary. The Access System is designed to be equally appropriate for operation by you or your customer.

Control over these special features is by two different SECURITY CODES – a MANAGER CODE and an OPERATOR CODE. Whenever a Code is required to execute a Secure Feature, "coA" will appear in the display window to prompt for the Manager Code, or "coB" to prompt for the Operator Code. Security Codes can be any number from 0 to 999. Or, either Code may be set to null or empty, to bypass the requirement of entering a Code altogether. The Manager's Code is used to control access to certain system setup parameters, while the Operator Code is used to restrict Customer access. The MANAGER CODE, or Code A, is factory set at 999. The OPERATOR CODE, or Code B, is factory set as blank or null.

Changing the Manager's Code requires you to press and hold the recessed button on the Control Panel. To reach the button, you must unbend a paper clip and insert it through the hole in the Control Panel as shown. While holding the recessed button, short press the A key. The Manager's Code will appear. To change the code, press the C key to backspace, and then enter a new three digit code and long-press the A key to enter. Release the recessed button to exit Change Password Mode. Changing the Operator's Code is a similar process: while holding the recessed button, short press the B key. The Operator's Code will appear. To change the code, press the C key to backspace, and then enter a new three digit code. Long-press the B key to enter. Release the recessed button to exit Change Password Mode.

Recessed button used to activate Change Password Mode.

All Secure Commands are initiated by PRESSING the SECURE Key, followed by the number of the desired feature or function. During Secure Command key sequences, the SECURE Key is used like an "Enter" key to confirm input and move to the next operator prompt. Also, the Arrow Keys, depicted as ▲ for UP and ▼ for DOWN, are used to toggle between available choices. When one Secure Command has an impact on, or is dependent on another, that is also noted. The Manager Code may be substituted at any prompt for the Operator Code. Of course, the opposite is not true.

Most secure functions have a TIMEOUT function that automatically terminates the command in process and puts you back where you were previously if the keystrokes are not entered properly or if you take too long. So if you are interrupted in the middle of entering a Secure Command, you need not worry about the system being inadvertently left vulnerable. It may take a little practice for the Secure Features to become second nature. After all, this aspect of the Control Panel's operation is security related and should not be too obvious.

TIP: If you experience any initial uncertainty in entering any Secure Command, DOUBLE-CLICKING the SECURE Key will terminate the current command sequence and return the Control Panel to its previous state, allowing you to start over.

The different Secure Commands are listed in the following section along with an explanation of what each code does.

Using the Secure Features

Please acquaint yourself with the Secure 91 and Secure 95 Codes first, since they are generally required for other Secure Features to operate. Generally, those Secure Features that are used frequently and by store personnel have lower numbers to reduce keystrokes. Secure Features requiring the Manager Code to make changes generally have higher numbers.

In this section, the keys to press are capitalized. Keystrokes are separated by a dot (•). The entry of numbers is indicated by the # sign, one for each possible digit. An asterisk (*) indicates that a keystroke is optional, that is, it will automatically execute if the key is not pressed.

SECURE 0 – Display Sleep Mode

The Sleep Mode provides the equivalent of a master on/off switch for the display system. When in sleep mode, the switching system is still powered but all products are deselected, all lights on the Control Panel are off (except for a single flashing LED "pulse"), 12-volt ignition power to car audio products is turned off, and all operator input is ignored, except to awaken the system.

- Secure 91 must be ON to use this feature.
- POWER switch on the 980 System Module must be in the OFF position.

To Initiate Sleep Mode (turn system OFF):

- 1) SECURE • 0 • SECURE*

To Awaken (turn system ON):

- 1) Press any key.
If no Operator Code is defined the system will awaken immediately.
Otherwise, you will be prompted for Code B (coB). Proceed to Step 2 below.
- 2) # • # • # • SECURE*

SECURE 1 – System Lockout

Causes the system to ignore all operator input from the Control Panel, Product Select Buttons, or 905 Remote. This is very useful to prevent unwanted system tampering.

- Secure 91 must be ON to use this feature.

To Lockout or Unlock System, PRESS:

- 1) SECURE • 1 • SECURE*
- 2) ▲ or ▼ toggles between 'ON' (locked out) & 'OFF' (unlocked)
- 3) SECURE*
"LO" appears in 3 character window when system is locked out.
If 'coB' appears in 3 character display window, enter 3-digit Code A or Code B, described in Step 4.
- 4) # • # • # • SECURE*

SECURE 2 – Product Group Lockout

Deselects all products in the affected Product Group and prevents any product in the group from being selected. Multiple Product Groups may be locked out one Product Group at a time.

- Secure 91 must be on to use this feature

To Lockout a Product Group:

- 1) Press Select Key of Product Group to Lockout
- 2) SECURE • 2 • SECURE*
"LO" appears in selected Product Group window.

To Unlock a Product Group:

- 1) Select locked Product Group by pressing its key, then PRESS
- 2) SECURE • 2 • SECURE*
If "coB" appears in 3 character display window, enter 3-digit Code A or Code B, described in Step 3.
- 3) # • # • # • SECURE*

SECURE 3 – SPL AutoLimiting (902 Only)

This feature uses the 902's EVC microphone to monitor the Sound Pressure Level (SPL) in the demo area. If the SPL reaches a preset limit (set by Manager with SECURE 93), the Control Panel will automatically engage Muting Level 2 to reduce the SPL below the allowable threshold.

- Secure 91 must be on to use this feature

To Engage or Disengage SPL AutoLimiting Feature, PRESS:

- 1) SECURE • 3 • SECURE*
- 2) ▲ or ▼ toggles between ON (AutoLimiting Engaged) & OFF (AutoLimiting Disengaged)
- 3) SECURE*
If 'coB' appears in 3 character display window, enter 3-digit Code A or Code B, described in Step 4.
- 4) # • # • # • SECURE*
LED beside the SECURE Key will remain ON when this feature is engaged.

SECURE 5 – TheftAlert Alarm Reset

Shuts off alarm or siren after TheftAlert detects that a product has been removed without permission, and resets TheftAlert to detect another theft.

- Secure 91 & Secure 95 must be on to use this feature.
- TheftAlert switch on the 980 system module must be in the OFF position.

To turn off Alarm, PRESS:

- 1) SECURE • 5 • SECURE*

SECURE 87 – TheftAlert Alarm Memory Display & Clear

Displays from memory the product numbers of any components that have triggered a TheftAlert alarm, and allows memory contents to be cleared after being displayed.

- Secure 91 & Secure 95 must be on to use this feature.

To display or clear a Theft Alert alarm, PRESS:

- 1) SECURE • 8 • 7 • SECURE*
If desired, press SECURE to end flashing displays before 30 second timeout.
- 2) LPress SECURE to clear TheftAlert memory.
If “coA” appears in 3 character display window, enter 3-digit Code A or Code B, described in Step 3.
- 3) # • # • # • SECURE*

SECURE 88 – System Hardware Reset

Provides a method for forcing a hardware reset (warm boot) for the control panel, switch modules, and 980 system module. Used after changing switching module address, control panel DIP switch settings, etc. to store new values, as a convenient alternative to removing power from the system.

To reset system, PRESS:

- 1) SECURE • 8 • 8 • SECURE*

SECURE 89 – Display Software Revision Number

Causes software revision number to be displayed in the 3 character window for 2 seconds.

To display software revision number, PRESS:

- 1) SECURE • 8 • 9 • SECURE*

SECURE 91 – Global On/Off for Secure Commands

Provides a master on/off toggle for most secure features.

To turn Secure features ON/OFF, PRESS:

- 1) SECURE • 9 • 1 • SECURE*
- 2) Use the ▲ or ▼ keys to toggle between “ON” (features enabled) & “OFF” (features disabled)
- 3) SECURE*
If “coA” appears in 3 character display window, enter 3-digit Code A in Step 4.
- 4) # • # • # • SECURE*

SECURE 92 – Specify a Default System Selection

When on, provides the capability for the control panel to automatically activate a 'default' system after a specified period of input inactivity at the Control Panel or Product Selector Buttons.

- Secure 91 must be on to use this feature.

To Specify a Default System Selection or Turn Feature OFF:

- 1) Select desired system on Control Panel, then PRESS:
- 2) SECURE • 9 • 2 • SECURE*
- 3) "OFF" (feature disabled) or "###" (feature ON) minutes will be shown.
- 4) Press ▲ or ▼ Keys to set the number of minutes of inactivity to activate the default system.
PRESSING ▼ until "OFF" appears in 3 character window turns feature off.
- 5) SECURE*
If "coA" appears in 3 character display window, enter 3-digit Code A in Step 6.
- 6) # • # • # • SECURE*

SECURE 93 – Set SPL AutoLimiting Threshold (902 Only)

Allows the Manager to change the value for the maximum Sound Pressure Level (SPL) threshold, used for Secure Feature #3 "SPL AutoLimiting." The default value from the factory is 85dB.

- Secure 91 must be on to use this feature.

To change the SPL AutoLimiting Threshold, PRESS:

- 1) SECURE • 9 • 3 • SECURE*
"###" appears in prompt window to indicate current SPL value.
- 2) Enter desired value with numeric keypad.
- 3) SECURE*
If "coA" appears in 3 character display window, enter 3-digit Code A in Step 4.
- 4) # • # • # • SECURE*

SECURE 94 – EVC AutoCalibration Master On/Off (902 Only)

Allows the EVC AutoCalibration feature to be disabled. This may be desirable when management does not want AutoCal run indiscriminately, or wants to prevent custom EVC attenuation settings from being automatically overwritten by AutoCal.

- Secure 91 must be on to use this feature.

To Turn the AutoCal feature On or Off, PRESS:

- 1) SECURE • 9 • 4 • SECURE*
- 2) Use the ▲ or ▼ keys to toggle between "ON" (AutoCal enabled) & "OFF" (AutoCal disabled).
- 3) SECURE*
If "coA" appears in 3 character display window, enter 3-digit Code A in Step 4.
- 4) # • # • # • SECURE*

SECURE 95 – TheftAlert Master ON/OFF

Allows the TheftAlert Merchandise Sentinel feature to be turned on or off. Also useful if the display contains products that trigger false alarms.

- Secure 91 must be on to use this feature.

To Turn TheftAlert On or Off, PRESS:

- 1) SECURE • 9 • 5 • SECURE*
- 2) Use the ▲ or ▼ keys to toggle between “ON” (TheftAlert enabled) & “OFF” (TheftAlert disabled).
- 3) SECURE*
If “coA” appears in 3 character display window, enter 3-digit Code A in Step 4.
- 4) # • # • # • SECURE*

SECURE 96 – Systems Write Protection Feature ON or OFF

Write Protection prevents inadvertent or unauthorized changes to management’s stored systems. When the Systems are Write Protected (this feature ON), over-writing a stored system requires the entry of the Manager Code (Code A). Given this, if there are several Write Protected systems to change, it is easiest to turn this feature OFF temporarily to eliminate the Code A prompt, then turn it back ON, once editing is completed.

- Secure 91 must be on to use this feature.

To Turn Systems Write Protection ON or OFF, PRESS:

- 1) SECURE • 9 • 6 • SECURE*
- 2) Use the ▲ or ▼ keys to toggle between “ON” (Write Protect enabled) & “OFF” (Write Protect disabled).
- 3) SECURE*
If “coA” appears in 3 character display window, enter 3-digit Code A in Step 4.
- 4) # • # • # • SECURE*

SECURE 97 – Set System Write Protect Status for Current Selection.

Provides a quick method for setting an individual system's Write Protect status. For setting write protect status for a range of systems use Secure 98.

- Secure 91 must be on to use this feature.

To Write Protect/Unprotect a Single System, PRESS:

- 1) SECURE • 9 • 7 • SECURE*
- 2) Use the ▲ or ▼ keys to toggle between “ON” (Write Protect enabled) & “OFF” (Write Protect disabled).
- 3) SECURE*
If “coA” appears in 3 character display window, enter 3-digit Code A in Step 4.
- 4) # • # • # • SECURE*

SECURE 98 – Specify a Range of Systems to Write Protect

Allows a range of systems (1-99) to be specified for write protection. The command sequence will prompt you to specify the Low and High numbers in the range to be protected.

- Secure 91 must be on to use this feature.

To specify a range of systems to Write Protect, PRESS:

- 1) SECURE • 9 • 8 • SECURE*
“L##” appears in 3 character window.
- 2) Use the ▲ or ▼ Keys to select the lowest system number in the range.
Use the C-Key as a deleting backspace key if needed.
- 3) SECURE*
- 4) Use the ▲ or ▼ Keys to select the highest system number in the range.
- 5) SECURE*
If “coA” appears in 3 character display window, enter 3-digit Code A in Step 6.
- 6) # • # • # • SECURE*

Using Product Selector Buttons

Product Selector Buttons offer a very friendly interface that encourages self-service. They also make a powerful addition to the merchandising flexibility of systems that use Control Panels. If you have both a Control Panel and Product Selector Buttons, notice that the Product Selector Buttons communicate with the Control Panel and vice versa through the bi-directional architecture of your system. Any selection made with a Product Selector Button will be confirmed by the Product Selector Button’s LED and in the selected component’s Product Group window on the Control Panel.

Usually, Product Selector Buttons are located adjacent to the component they select. To use a Product Selector Button, simply PRESS it momentarily. The green LED will light and your selection will play, assuming you have source material. PRESSing an alternate component’s Product Selector Button will activate the new selection and deactivate the previous selection. To turn a selected component OFF, simply PRESS its Product Selector Button.

One can play multiple pairs of speakers using Product Selector Buttons by adding additional pairs to the current selection (the maximum number of pairs allowed is determined at installation). To add a pair of speakers to the current selection, LPRESS the Product Selector Button for the set of speakers you wish to add. To deselect one of the multiple pairs playing, PRESS its Product Selector Button.

Using the 905 Remote Control

The 905 IR Remote is very easy to use. Every system feature is available from the remote (version 3.4 and later Control Panels, use Secure 89 to determine your version). To use the 905, point it in the direction of the Control Panel or Model 990 External IR Receiver and enter your command. The keystrokes and functions work exactly like the keypad on the Control Panel, except for selecting the active Product Group.

To SELECT a Product Group from the remote numerically, PRESS the GROUP button on the remote, then key-in the desired Product Group number (1 – 32 starting at the top of the Control Panel), and PRESS the ENTER-Key.

You can also use the ▲ and ▼ ARROW keys to SELECT a Product Group by PRESSing the GROUP key, then using the ▲ or ▼ ARROW to move to the desired Product Group.

If the last Product Group on your Control Panel is reserved for Systems (see page 3), then PRESS the SYSTEM key on the remote to go directly to the Systems Product Group.

Once the desired Product Group is active, SELECT the component you wish to demonstrate by entering that component's 1 or 2-digit product ID number. PRESS the ENTER-Key on the remote or wait 2 seconds for auto-entry.

Enhanced features

902/903 Control Panels with version 3.4 software or later include the following functions to the 905 remote.

To store the current selections in an unused product group:

Group • # • # • LPRESS-ENTER

The same sequence applied to a speaker group facilitates speaker add. This sequence behaves just like LPRESSing a Product Group button.

To store the current selections in the 99 systems group:

System • # • # • LPRESS-ENTER.

(This function must be enabled on the dip switch, see page 3.) This sequence acts just like LPRESSing the 99 systems Product Group button.

To disconnect/recall the active product in a group just like a double clicked Product Group button on display:

Group • # • # • DOUBLE CLICK-ENTER

Double click needs to be two moderate presses rather than the speed you would use with a computer mouse. If you have trouble with double click, slow down and make two distinct presses.

Group • # • # will time out and act like short press Product Group after 2 seconds on inactivity.

Group • ▲ and Group • ▼ cycles through Product Groups as long as the arrow key is held down.

Troubleshooting

There are two common conditions that can cause a system to malfunction:

- 1) Switching Modules that are not properly addressed.
- 2) Buses are improperly connected (system bus, high-level bus, low-level bus).

Either of these conditions can cause the system to be "confused" since the Control Panel cannot then communicate with all switching modules. All of the module addresses should have been set and all the bus networks connected by the person(s) who originally installed your system. If this was not properly done or if any module addresses have been changed, or new modules added to the system since the original installation, someone will have to verify all the address settings and check all the bus connections in your system before further troubleshooting can continue. Run the self-diagnostic tests on page 6 to discover module addressing problems and refer to the original Installation Manual for instructions on module addresses and bus connections.

Questions, user input and suggestions are always welcome. Should you have a comment or need help in using your *Access*™ Demonstration Network, please call us at 800/322-8346. We'll be happy to hear from you. Thank you for your support of our products and services.
